CC The cDNA was isolated from a Hela cell CDNA library using mouse CC SAG cDNA (see AAX87311) as probe. SAG is highly conserved among CC secies. Disruption in yeast was shown to be lethal. SAG deletion CC mutants (see AAX87315-16) have been identified in human cancer lines, cc suggesting a role in carcinogenesis. SAG genes, and mutant SAG CC genes, can be used to protect cells from apoptosis induced by redox CC genes, can be used to protect cells from apoptosis induced by redox CC tumour cells. The SAG genes can also be used for the recombinant CC production of the SAG proteins. The SAG proteins can be used to scavenge oxygen radicals in organisms and to promote wound healing. C Additionally, the SAG genes or their complements can be used to protein is also an ideal molecular target in the development of constant natural constant and mutant and mutant?
                                                                                                                                                                                                                                                                                                                 밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cc include autoimmune diseases e.g. rheumatoid arthritis,

Chyperproliferative disorders e.g. neoplasms of the breast or liver,

cc cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders

Cc e.g. cerebral ischaemia, angiogenesis, nervous system disorders e.g.

Alzheimer's disease, infections caused by bacteria, viruses and fungi

Cc and ocular disorders e.g. corneal infection, and many other

Cc disorders listed in the specification. The polypeptides can also

Cc be used to aid wound healing and epithelial cell proliferation, to

Cc prevent skin aging due to sumburn, to maintain organs before

Cc transplantation, for supporting cell culture of primary tissues, to

Cc regenerate tissues and in chemotaxis. The polypeptides can also be used

Cc as a food additive or preservative to increase or decrease storage

Cc as a food additive or preservative to increase or decrease storage

Cc apabilities, fat content, lipid, protein, carbohydrate, vittamins,

Cc minerals, cofactors and other nutritional components. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassay e.g. radioimmunoassays or enzyme linked
                                                                                                                                                                                                                                                                                                                                                       hyperproliferative disorder; cardiovascular disorder; cardiac arrest; cerebrovascular disorder; cerebral ischaemia; angiogenesis; nervous system disorder; Alzheimer's disease; infection; ocular disorder; corneal infection; wound healing; epithelial cell proliferation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diagnosing, used as foo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     diagnostic immunoassays e.g. radioimmunoassays or enzyme linked
c immunosorbant assays (ELISA). Disorders which are diagnosed or treated
c include autoimmune diseases e.g. rheumatoid arthritis,
c hyperproliferative disorders e.g. rheumatoid arthritis,
c reprovance a control isorders e.g. rheumatoid arthritis,
c e.g. cerebroal isorders e.g. cardiac arrest, cerebrovascular disorders
c e.g. cerebral ischaemia, angiogenesis, nervous system disorders e.g.
c e.g. cerebral ischaemia, angiogenesis, nervous system disorders e.g.
c Alzheimer's disease, infections caused by bacteria, viruses and fungi
and coular disorders e.g. corneal infection, and many other
c disorders listed in the specification. The polypeptides can also
be used to aid wound healing and epithelial cell proliferation, to
c prevent skin aging due to sunburn, to maintain organs before
c transplantation, for supporting cell culture of primary tissues, to
c egenerate tissues and in chemotaxis. The polypeptides can also be used
c as a food additive or preservative to increase storage
c exchange a food additive or preservative to increase storage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

CC The invention relates to human novel polypeptides and their associated CC polynucleotides. The polypeptides and polynucleotides are useful in gene CC therapy for treating, inhibiting or preventing neural disorders, immune CC system disorders (e.g. systemic lupus erythematosus, rheumatoid CC arthritis and multiple sclerosis), muscular disorders, respiratory CC diseases (e.g. nasal vestibulitis, nasal polyps and sinusitis), CC reproductive disorders, gastrointestinal disorders, pulmonary disorders, CC cardiovascular disorders (e.g. congenital heart defects, Ebstein's CC anomaly and hypoplastic left heart syndrome), renal disorders (e.g. acute (e.g. Hodgkin's disease and leukaemia), inflammatory diseases (e.g. CC (e.g. Hodgkin's disease and leukaemia), inflammatory diseases (e.g. conditions (e.g. asthma), blood related disorders (e.g. thrombosis, conditions (e.g. asthma), blood related disorders (e.g. thrombosis, conditions ABX73173-ABX74167 represent human novel polynucleotides of the

                                                                                                                                                                                                                    The invention relates to human novel polypeptides and their associated polynucleotides. The polypeptides and polynucleotides are useful in gene conterable for treating, inhibiting or preventing neural disorders, immune system disorders (e.g. systemic lupus erythematosus, rheumatoid carthritis and multiple sclerosis), muscular disorders, respiratory conferences (e.g. nesal vestibulitis, nasal polyps and sinusitis), cardiovascular disorders (e.g. congenital heart defects, Ebstein's canomaly and hypoplastic left heart syndrome), renal disorders (e.g. canomaly and hypoplastic left heart syndrome), renal disorders (e.g. cliney failure and end-stage renal disease), hyperproliferative disorders (e.g. Hodgkin's disease and leukaemia), inflammatory diseases (e.g. conditions (e.g. sathma), blood related disorders (e.g. thrombosis, conditions) (e.g. sathma), blood related disorders (e.g. thrombosis, conditions) (e.g. sathma), blood related disorders (e.g. sathma), blood related diso

                                                                                                                                                                                                                                                                     antiinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellicus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allerdies, anlestic anaemia, burns, wounds, bone and cartilage demane
                                                                                                                                                                                                              allergies, aplastic anaemia, burns, wounds, bone and cartilage damage nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidabetic; hypotensive; dermatological; immunosuppressive; antidabetic; hypotensive; dermatological; immunosuppressive;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel nucleic acids and peptides derived from open reading useful for treating e.g. cancers, proliferative disorders, neurodegenerative disorders and cardiovascular disease -

                                                                                                                                             SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.
                                                                                                                                                                                                                     double SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG oligomerization. These properties were unaffected by the MM4 mutation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype.
                                                                                                                                                                                                                                                                                                            This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM4, which codes for a SAG protein (see AAY06498) in which the Cys residue at position of the native protein (see AAY06492) is replaced by a Ser residue owing to a mutation of codon 50 from TGC to AGC obtained by site-directed mutagenesis of SAG cDNA. This residue is at zinc-ring finger 1 of SAG. Single and

                                                                                                                                       This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM13, which codes for a SAG protein (see AAY06507) CC (in which the Cys residues at positions 61 and 64 of the native protein (see AAY06492) are replaced by Ser residues owing to grotein (see AAY06492) are replaced by Ser residues owing to commutations of codons 61 and 64 through site-directed mutagenesis of CC (SAG CDNA. These residues are in zinc ring finger 1 of SAG. Single CSAG CDNA. These residues are in zinc ring finger 1 of SAG. Single CO (SAG CDNA. These residues are in zinc ring finger to determine the role of each cysteine residue of SAG in haem binding and SAG CD (somerization. MM13 showed greatly reduced haem binding (and a CC oligomerization. MM13 showed greatly reduced haem binding (and a CC of company) but oligomerization was unaffected. SAG is correspond for finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the C from apoptosis, scavenges oxygen radicals and can be used for the century production of the used for the recombinant production of C reagents. They can also be used for the development of C sAG proteins, which are molecular targets in the development of darugs against neurodegenerative disorders, cancers and muscle

                                                                                              in SAG RNA, but not in genomic DNA. It suggests a possible role for SAG in human carcinogenesis. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. Antisense SAG genes can be used to inhibit the growth of tumour cells. The SAG genes can also be used for the recombinant tumour cells. The SAG genes can also be used for the recombinant production of the SAG proteins. The SAG proteins can be used to scavenge oxygen radicals in organisms and to promote wound healing. Additionally the SAG genes or their complements can be used to promote or inhibit the growth of plant cells (all claimed). The SAG protein is also an ideal molecular target in the development of drugs against neurodegenerative disorders, cancers and muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the nucleotide sequence of deletion mutant 1 of the novel human sensitive to apoptosis gene SAG (see also AAX87314). The cDNJ was obtained by PCR amplification of RNA isolated from DLD-1 colon carcinoma cells (ATCC CCL 221). It contains a 7 bp deletion compared with native SAG, starting at nucleotide 170 of the coding region that codes for a potential haem binding site. The frame shift deletion abolishes the downstream zinc finger in the resulting protein (see AAY06493). The mutation was detected by PCR resulting protein (see AAY06493).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homo sapiens.

                                                                            oligomerization. These properties were unaffected by the MM2 mutation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.
                                                                                                                                                                                                           This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM2, which codes for a SAG protein (see AAY06496) in which the Cys residue at position 53 of the native protein (see AAY06492) is replaced by a Ser residue owing to a mutation of codon 50 from TGC to AGC obtained by site-directed mutagenesis of SAG CDNA. This residue is at a haem binding site of SAG. Single and double SAG mutantes (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG oligomerization. These properties were unaffected by the MM2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CDS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PAXR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PXXB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Σg
                                       This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MMJ, which codes for a SAG protein (see AAY06497) in which the Cys residues at positions 50 and 53 of the native protein (see AAY06492) are replaced by Ser residues owing to mutations of codons 50 and 53 from TGC to AGC Obtained by site-directed mutagenesis of SAG cDMA. These residues are at a haem binding site of SAG. Single and double SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG oligomerization. MM3 showed greatly reduced haem binding and SAG oligomerization. MM3 showed greatly reduced haem binding and SAG oligomerization was unaffected. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the development of SAG proteins, which are molecular targets in the development of durings against neurodegenerative disorders, cancers and muscle
                                                                                                                                                                                                                                                                                                                                                                          SAG: Sensitive to Apoptosis Gene and promoting cell growth and protecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  27-SEP-1999

The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The libraries are useful for detecting mRNAs from a complete coligonucleotide libraries are useful for detecting mRNAs from a companie coligonucleotide libraries are useful for detecting mRNAs from a companie coligonucleotide libraries are useful for detecting mRNAs from a companie coligonucleotide coligonucleotide coligonucleotide coligonucleotide coligonucleotide sequences from a particular biological or pathology-specific genes such as those genes condition; to detect transcripts of a sub-transcriptome allowing the condition; to detect developmental specific genes such as those genes condition; to detect developmental specific genes; and to detect RNA condition; to detect developmental specific genes; and to detect RNA condition; to detect ABN27253 to ABN39589 represent suffering from a particular disorder. ABN27253 to ABN39589 represent coligonucleotide sequences from rates, humans and mice, which are used in coligonucleotide sequences from rates, humans and mice, which are used in coligonucleotide sequences from rates, humans and mice.
                                                                                                                          Query Match

The polynucleotides are useful for identifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABP68902-ABP69849) are useful as molecular weight markers, as a food supplement, for generating antibodies, in medical imaging, screening and dispostic assays and for treating cell-proliferative disorders (cancer), neurodegenerative diseases
Human ORFX ORF3048 polynucleotide sequence SEQ ID NO:6095
                                                                                                                                                                                                                                                                                                                                                                      (Parkinson's or Alzheimer's disease), autoimmune diseases (multiple sclerosis, diabetes, lupus) genetic disorders, myeloid or lymphoid disorders, platelet or coagulation disorders, wound, burns, incision, ulcers, liver or lung fibrosis, infections (bacterial, viral, fungal, parasitic), arthritis, etc.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antiinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating preventing conditions associated with an ORFX-associated disorder. The mucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allored damage.

                                                                                                                                                            possible role for SAG in human carcinogenesis. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. Antisense SAG genes can be used to inhibit the growth of tumour cells. The SAG genes can also be used for the recombinant production of the SAG proteins. The SAG proteins can be used to scavenge oxygen radicals in organisms and to promote wound healing. Additionally, the SAG genes or their complements can be used to promote or inhibit the growth of plant cells (all claimed). The SAG protein is also an ideal molecular target in the development of drugs against neurodegenerative
                                                                                                                                                                                                                                                                                                                                                       This is the nucleotide sequence of deletion mutant 2 of the novel human sensitive to apoptosis gene SAG (see also AAX87314). The cDNA was obtained by PCR amplification of RNA isolated from DLD-1 colon carcinoma cells (ATCC CCT 221). It contains a 48 bp deletion compared with native SAG, starting at nucleotide 177 of the coding region that codes for a potential haem binding site. The in-frame
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SAG gene; sensitive to apoptosis; human; cancer; tumour; neurodegenerative disease; muscular dystrophy; wound healing; vulnerary; therapy; mutant; colon carcinoma; ds.

                                                                                                                                                                                                                                                                                           The invention relates to human breast cancer expressed polynucleotides (AALO/544-AAL26798) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human breast cancer expressed polynucleotides (AAL07544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic sprinter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 596 BP; 166

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human breast cancer expressed polynucleotide (AAL07544-AAL26799) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                            Methylococcus capsulatus genes, oligonucleotides representative

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              number of Methylococcus capsulatus genes. The method of the invention is useful for determination of the differential expression of the genes of M. capsulatus, and for studying gene expression on a genomic scale and in gene expression assays of M. capsulatus genes. The sequences shown in ABQ90016-ABQ91855 represent M. capsulatus genes for use in arrays of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                              17-JAN-2001;

                                                                                                                                                               The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, cother cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune cother cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune cother cancers e.g. Addison's disease, altergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, comultiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) caractiovascular disorders such as myocardial ischaemias; (d) wound chaling; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and of the chious diseases such as viral, bacterial, fungal and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       17.NOV-2000

                                                                                                                        embryos; increases or decreases the differentiation or proliferation of embryonic stem cells, besides, haematopoietic lineage, modulates mammalian characteristics, such as, body height, weight, hair colour, eye colour, skin, percentage of adipose tissue, pigmentation, size, and shape (e.g., cosmetic surgery); modulates mammalian metabolism; changes mammal's metal state or physical state by influencing biorhythms, caricadic rhythms, depression, tendency for violence, tolerance for pain, reproductive capabilities, hormonal or endocrine levels, appetite, libido, memory, or stress; increases or decreases storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors or other nutritional components. This sequence encodes a novel human
                                                                                                                                                                                                                                                                                                                             transports or bone grafts; prevents skin aging due to sunburn by stimulating keratinocyte growth; prevents hair loss, since Fg family members activate hair forming cells and promotes melanocyte growth; stimulates growth and differentiation of hematopoietic cells and bone marrow cells when used in combination with other cytokines; maintains organs before transplantation or for supporting cell culture of primary tissues; induces tissue of mesodermal origin to differentiate in early
                                                                                                                                                                                                                                                                                                                                                                                                                                                        and limb regeneration; stimulates neuronal growth; can treat and prevenerative neuronal damage occurring in certain disorders or neurodegenerative conditions, such as, Alzheimer's disease, Parkinson's disease, and AIDS-related complex; stimulates chondrocyte growth, thus they can be used to enhance bone and periodontal regeneration and aid in tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes an isolated nucleic acid molecule comprising a sequence encoding musculoskeletal system associated polypeptides useful for detecting disorders, e.g., cancer or cancer metastases, in animals or humans. The nucleic acid: stimulates re-vascularisation of ischaemic tissues associated with conditions such as thrombosis, arteriosclerosis,

                                                                                                                                                                                                                      Ś
                                                                                                                                                                                                                                                                                                                                                                   Delynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sittes expressing (II). (I) and (II) are useful for treating the disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in the polypeptide and polynucleotide sequences application of mutations tresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and conditions are coding sequences. AbS44197-AAS94564 represent novel human codi diagnostic coding sequences of the invention.

CC specification, but was obtained in electronic format directly from WIPO and train and not appear in the printed sequence where the invention.
                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       30-MAR-2001; 2001WO-US08631.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 1; SEQ ID No 20434; 103pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        transplant rejection, asthma, sepsis, reperfusion injury, stroke or infection. The GM4,6D peptide or a polynucleotide encoding it is also useful for manufacturing complex carbohydrates and as targets for screening small molecule antegonists of the activity of the enzyme. The polynucleotide is useful in developing an assay for defects in the enzyme, as well as in gene replacement therapy. Sequences ABX17942-ABX17942 and ABX17947-ABX3371G represent DNA molecules encoding human GM4,6D peptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            22-NOV-1996;

                                                                                                                                                                                   S
                                                                                                                                                                                                                                                        CC nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting CC the probes with a collection of detectably labelled nucleic acids CC derived from mRNA of human breast, and then measuring the label CC bound to each probe of the microarray. The probes are useful for CC verifying the expression of regions of genomic DNA predicted to CC encode proteins. They are useful for gene discovery, and for CC expression analysis is useful for assessing breast disease. Gene CC expression analysis is useful for assessing the toxicity of chemical CC agents on cells. The microarray of this invention presents a far greater CC diversity of probes for measuring gene expression, with far less bias CC than expressed sequence tag microarrays. The method is suitable for collect the sequence is a single exon nucleic acid probe of the invention. CC Note: The sequence data for this pattent did not form part of the printed specification, but was obtained in electronic format directly crown wide of the intention into published pct sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a spatially-addressable set of single exon conclusions and probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids cound to each probe of the microarray. The probes are useful for cerifying the expression of regions of genomic DNA predicted to cerifying the expression of regions of genomic DNA predicted to cencede proteins. They are useful for gene discovery, and for cencede proteins is useful for gene discovery, and for ceromode proteins is useful for prognosing breast disease. Gene ce expression analysis is useful for sessentian the toxicity of chemical agents on cells. The microarray of this invention presents a far greater condiversity of probes for measuring gene expression, with far less bias chan expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the control of the liverity and the part of the control of the liverity of the liverity of the liverity forms of the liverity of the liverity of the liverity forms of the liverity of the liverity forms of the liverity of the liverity forms of the l
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PR PX PX PX XX XX

                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention.
                                                                                                                                                                                                Human
                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 355
                                                                                                                                                                                                                                                                                                                                                                                                                          Note: The sequence data for this patent did not form printed specification, but was obtained in electronic from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular systematic problems.
                                                                                                                Claim 4; SEQ ID No 14849; 530pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular systems. Or cardiovascular disease, hypertension, cardiac arrhythmias and prognosity disease, hypertension, cardiac arrhythmias and

Human bone marrow expressed single exon probe SEQ ID NO: 5080.
                                                                                                                                                                                                                                                                 probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the

                                                                                                                                                                  probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention.
